

FINAL DEBUGGING REPORT

Portfolio Website

Brand refinement and mailto debugging for Sana Ejaz's responsive portfolio. The site now presents the full name in the navigation and the contact behavior has been tested both in context and in isolation.

01

Email diagnosis

The contact link is a plain mailto anchor with no target attribute. The site JavaScript contains no preventDefault or onclick handler. Hit testing at the link center resolves to the email anchor with pointer-events: auto.

02

Isolation result

A temporary bare page with only the mailto anchor produced a mailto request on a normal left-click. The browser harness reported ERR_ABORTED while handing the request to the operating system, pointing to Windows default email-app association rather than a site conflict.

03

Brand update

The top-left mark is now the full Sana Ejaz name. Fluid font sizing, nowrap, and a non-shrinking flex item preserve the navigation at 375px, 768px, and 1440px.

04

Motion system

The project visuals retain their CSS-only animation system: SVG ECG drawing, sequential chat bubbles, moving route marker, and scanning tracker. Decorative elements are absolutely positioned to avoid layout shift.

05

Accessibility

The contact link remains keyboard accessible, the full brand has a descriptive label, and animation respects prefers-reduced-motion. The temporary isolation page is not included in final deliverables.

06

Verification

Node tests pass. Browser checks confirmed the email href, absent target, uncanceled click event, correct hit testing, and brand/navigation bounds at all requested widths.

Responsive checkpoints

375px: full brand remains contained.

768px: brand and nav remain separated.

1440px: full navigation has comfortable spacing.
