

FINAL CONTACT UPDATE

Portfolio Website

The portfolio contact action now copies Sana Ejaz's email reliably for web-based Gmail users, with accessible feedback, a legacy fallback, and responsive button sizing.

01

Copy behavior

The native button copies hafizasanaawan@gmail.com using navigator.clipboard.writeText(). It changes to Copied!, announces success through an aria-live region, and restores its email label after two seconds.

02

Legacy fallback

When Clipboard API support is unavailable or rejected, the handler creates a temporary hidden input and uses document.execCommand('copy'), then removes the input cleanly.

03

Keyboard access

Because the control is a real button, both Enter and Space activate it without custom key handling. The accessible name identifies the exact email being copied.

04

Browser verification

A browser click copied the exact address and triggered the live status. The label reset after two seconds. Enter activation also copied successfully, and the fallback command was exercised separately.

05

Responsive layout

The copy button remains inside the contact container at 375px, 768px, and 1440px. The email label can wrap safely without shifting surrounding layout.

06

Project motion

The portfolio retains the lightweight CSS-only animation system: SVG ECG drawing, sequential chat bubbles, moving route marker, and scanner tracking motion with reduced-motion support.

Contact states

Default: hafizasanaawan@gmail.com

Success: Copied! plus live announcement

Fallback: hidden input and execCommand copy
