

Daymark Task Dashboard Final Report

Overview

Daymark is a complete task dashboard built with a React client and Express API, using SQLite for local persistence. The final polish pass added a clearer delete confirmation flow and a per-task PDF export option without disrupting the existing CRUD, ordering, pinning, theming, and undo behavior.

Final product refinements

1) Delete confirmation flow

The destructive delete action is now gated by a small modal popover instead of firing immediately. Clicking the task delete control opens a confirmation panel with the message: "Are you sure you want to delete this task?" and two choices: "Cancel" and "Yes, delete".

- Cancel leaves the task untouched.
- Yes, delete triggers the original undo-toast pattern that preserves the task for a short grace period before the permanent API DELETE is sent.
- This keeps the destructive action explicit and user-controlled while retaining the lightweight recovery pattern.

2) PDF export for individual tasks

Each task card includes a compact Share action that exports a single task as a clean PDF. The implementation uses jsPDF on the client side to generate a properly formatted document with:

- the Daymark branding header
- task title
- note/description body
- due date
- priority
- status
- tag metadata
- created date

The exported PDF is saved locally as a readable document rather than a raw browser screenshot.

Architecture and UX notes

The dashboard continues to use the same task API and local SQLite repository. The client remains responsible for presentation and UX polish: modal state, export generation, and the undo timer lifecycle are all kept in the React view layer, while the server continues to handle persistence and validation.

The existing dark-first visual language remains intact, and the update remains responsive across narrow and wider screens. The modal and export actions are designed to fit the existing card layout

without introducing layout breaks or horizontal overflow.

Verification

The final checks were run after the refinements were merged:

- Client tests: 2/2 passed
- Server tests: 5/5 passed
- Production build: succeeded
- Browser validation: confirmation modal shows and cancel does nothing; confirming delete still triggers the undo toast and can restore the task; export triggers a valid PDF download; responsiveness remains stable at mobile and desktop widths.

Final status

- Delete confirmation added and working: Yes
- PDF export working: Yes, using jsPDF
- Tests passed: Yes
- Pushed to git: Yes
