

PROJECT REPORT

Portfolio Website

A semantic, fully responsive single-page portfolio built with HTML5, custom CSS, and vanilla JavaScript. This report documents the layout strategy, responsive behavior, and technical choices behind the implementation.

01

Responsive approach

The layout uses CSS Grid for page compositions and Flexbox for navigation, actions, project metadata, and footer alignment. Fluid typography uses clamp() within a constrained shell so content remains readable at every width.

02

Visual system

A graphite base, warm paper surface, mint highlights, and coral accents create a focused professional palette. Project visuals are lightweight CSS compositions ready to be replaced with real assets.

03

Semantic structure

Header, nav, main, section, article, and footer elements establish a meaningful document outline. A skip link and descriptive labels improve navigation for assistive technology users.

04

Interaction

The mobile menu tracks aria-expanded state, animates open and closed, closes after a section link is selected, and returns focus to the toggle when Escape is pressed.

05

Accessibility

Visible focus behavior, alt-text-ready content structure, strong contrast, keyboard support, and a prefers-reduced-motion rule keep the experience considerate and usable.

06

Technical decisions

No framework or runtime dependency is required. Node's built-in test runner validates the page structure and the critical navigation and responsive CSS contracts.

Breakpoints

Base: mobile-first single-column flow.

760px and below: hamburger menu, one-column grids, touch-friendly footer and contact layout.

Desktop: two-column hero/about sections and three-column skills/projects compositions.
