

FINAL FEATURE REPORT

Task Dashboard

A complete interactive task workspace built with React, Express, and SQLite. This refinement adds richer task metadata, live discovery controls, a no-jump editing flow, and a more expressive product theme.

01

No-jump editing

Edit is a native button with an inline composer. The exact scroll position is captured before the form expands and restored with `useLayoutEffect`, so entering edit mode never sends the user to the top.

02

Task metadata

Tasks now persist priority (high, medium, low), optional ISO due dates, and optional tags. Priority adds colored card borders, due dates show overdue state, and tags render as chips.

03

Discovery controls

A live title/description/tag search, All/Active/Completed tabs, and sort options for created date, due date, and priority make larger task lists easy to navigate.

04

Progress and undo

A progress bar shows completed work at a glance. Delete removes the card immediately and offers a five-second Undo snackbar; only after the window closes is the API delete committed.

05

Product redesign

Daymark now uses a sky-blue canvas, violet/cyan accents, rounded glassy panels, soft depth, animated checkbox feedback, lifted buttons, and elevated task cards. It intentionally differs from Task 2.

06

Verification

Live walkthrough passed populated create, no-jump edit, search, Active filter, priority sort, complete, delete, Undo restore, and permanent deletion. Responsive checks passed at 375px, 768px, and 1440px.

Quality gates

4 backend tests passed.

2 frontend tests passed.

Build, persistence, and full CRUD walkthrough passed.
