

PROJECT REPORT

Task Dashboard

A full-stack CRUD workspace built with React, Express, and SQLite. Daymark keeps task data persistent while giving the daily workflow a calm, responsive interface.

01

Architecture

React runs on Vite at port 5173 and sends relative /api requests through the development proxy to Express on port 4000. Express routes delegate validation and responses to a controller and SQLite repository.

02

Persistence

better-sqlite3 creates the tasks table on startup and stores records in server/data/tasks.db. A reconnect test and live restart check both confirmed tasks survive process termination.

03

CRUD contract

GET lists tasks, POST creates them, PATCH and PUT update title, description, and status, and DELETE removes a task with a JSON confirmation. Invalid titles and statuses return readable 400 errors.

04

Product UI

A focused composer, task list, completion controls, inline edit mode, deletion confirmation, loading state, empty state, and visible error banner make the dashboard usable beyond a basic demo.

05

Responsive design

The desktop view uses a two-column workspace. Below 800px it becomes a single-column flow with touch-friendly controls and no horizontal overflow at 375px, 768px, or 1440px.

06

Testing

The server suite covers read, create, update, delete, validation, and file-backed persistence. Client checks cover CRUD request hooks, visible states, responsive rules, and motion support. The production Vite build passes.

Verification

4 backend tests passed.
2 frontend tests passed.
Production build and live CRUD walkthrough passed.
