

FINAL PROJECT REPORT

Portfolio Website

A semantic, fully responsive single-page portfolio for Sana Ejaz, presenting her education, full stack internship, AI/ML experience, technical skills, and four real projects.

01

Responsive approach

The layout uses CSS Grid for page compositions and Flexbox for navigation, actions, project metadata, and footer alignment. Fluid typography uses clamp() within a constrained shell so content remains readable at every width.

02

Visual system

A graphite base, warm paper surface, mint highlights, and coral accents create a focused professional palette. Four cohesive CSS project visuals keep the page lightweight while linking to GitHub repositories.

03

Profile content

The site identifies Sana as an IST Computer Science graduate and Progree Full Stack Development Intern, with experience in Python, C++, Java, NLP, search algorithms, and computer vision.

04

Real projects

The projects section covers CARDIVA, a sentiment classifier, a graph pathfinding agent, and a real-time computer vision pipeline, each with its supplied description and public repository link.

05

Accessibility

Semantic landmarks, a skip link, descriptive labels, visible focus behavior, keyboard Escape handling, strong contrast, and prefers-reduced-motion support keep the experience usable.

06

Technical decisions

No framework or runtime dependency is required. Node's built-in test runner validates the page structure, real content, navigation state, and responsive CSS contracts.

Breakpoints

Base: mobile-first single-column flow.

760px and below: hamburger menu, one-column grids, touch-friendly footer and contact layout.

Desktop: two-column hero/about sections and four-project responsive grid.
