

FINAL REFINEMENT REPORT

Portfolio Website

Final refinements to Sana Ejaz's responsive portfolio: a direct mailto link and genuinely looping, purpose-built project animations.

01

mailto behavior

The contact address remains a plain mailto anchor with no target attribute and no JavaScript click handler. A browser left-click event resolves to `mailto:hafizasanaawan@gmail.com` and is not canceled.

02

ECG animation

CARDIVA now uses an inline SVG path with `stroke-dasharray` and `stroke-dashoffset` keyframes. The ECG trace continuously draws from left to right and loops without changing layout.

03

Conversation motion

The sentiment visual uses two chat bubbles that pop in sequentially, translate slightly, fade, and repeat through a CSS ease-in-out loop.

04

Route motion

The pathfinding visual uses an SVG node graph and a coral marker whose CSS keyframes move through the visible node coordinates, then return to the start.

05

Scanner motion

The computer vision visual sweeps a scan line vertically and moves the tracking rectangle through small coordinate changes. All decorative animation is `aria-hidden` and honors reduced-motion settings.

06

Verification

Node tests pass. Browser checks confirmed no title overflow at 375px, 768px, and 1440px. Animation declarations are present at each width, and the route timeline is running with infinite iteration.

Motion system

SVG ECG: `stroke-dashoffset` draw loop.

Chat bubbles: sequential fade, pop, and translate.

Route marker and scanner: continuous CSS coordinate motion.
