

FINAL REFINEMENT REPORT

Portfolio Website

Final refinements to Sana Ejaz's responsive portfolio: a clickable email, overflow-safe project visuals, and four subtle project-themed animations.

01

Clickable contact

The contact address is a direct mailto link for hafizasanaawan@gmail.com, so selecting the visible email opens the visitor's configured email client.

02

Overflow-safe titles

Project visual words use responsive clamp() sizing, a constrained max-width, overflow-wrap, and centered line-height so labels stay inside their cards at mobile, tablet, and desktop widths.

03

Animation decision

LottieFiles search endpoints were not reliably accessible during implementation. To avoid broken remote assets or a heavy runtime, the site uses self-contained CSS animation fallbacks instead.

04

Project visual language

CARDIVA uses a pulse trace, sentiment uses conversational bubbles, pathfinding uses a pulsing node route, and computer vision uses a scanning target.

05

Performance and access

The animations are CSS-only, lightweight, and automatically respect prefers-reduced-motion. Decorative animation elements are aria-hidden so project content remains the accessible focus.

06

Verification

Node's built-in tests cover the mailto address, four animation hooks, responsive overflow rules, semantic structure, and existing navigation behavior. Browser geometry checks passed at 375px, 768px, and 1440px.

Responsive checkpoints

375px: one-column cards with wrapped labels.

768px: two-column grid with contained visual titles.

1440px: four-column grid with all labels inside their visual boxes.
